

Syllabus Macroeconomics –part II

This module deals with developments in business cycle analysis. Four instructors (Albonico, Barbaro, Tirelli and Ropele) will contribute an overall teaching load of 42 hours

Analysis of business cycle regularities and Real Business Cycle (RBC) theory (6 hours). RBC models essentially are stochastic versions of the Ramsey Cass and Koopmans model, where uncertainty is determined by the occurrence of productivity shocks. Instructor: Alice Albonico

Analysis of the basic New Keynesian model (3 hours). Prices are assumed to be sticky, in each period a fraction of firms cannot re-optimize its price and keep it fixed to the previous period. Intermediate good firms are monopolistically competitive. A role for monetary policy arises. Instructor Alice Albonico

Analysis of a medium scale DSGE model (3 hours). We will refer mainly to Christiano, Eichenbaum and Evans (2005) to introduce frictions in the New Keynesian model (price and wage indexation, wage stickiness, variable capacity utilization, habits in consumption, adjustment costs on investments). Impulse response functions analysis to different types of shocks. Instructor Alice Albonico

Unemployment models (3 hours). The basic BC model adopts a rudimentary description of the labor market. Firms hire workers in competitive spot labor markets and there is no unemployment. Search and matching models, (see Mortensen and Pissarides, 1994, for a seminal contribution), provide a suitable framework for understanding unemployment dynamics, the properties of vacancies and of flows in and out of the labor force. A number of contributions have incorporated search into RBC models. The course outlines the key ideas behind the models of job market search and discusses implications for business cycle models. Instructor: Patrizio Tirelli

Changing sources of volatility in business cycle models (3 hours). The turmoil of the Great Recession fueled research for a better understanding of the sources of aggregate volatility. Here we focus on three stylized shocks: i) sectoral productivity shocks; ii) news shocks; iii) uncertainty shocks. Instructor: Patrizio Tirelli

Optimal monetary policy in basic New Keynesian DSGE model (3 hours). We will study optimal monetary policy in two distinct settings, i.e. under discretion and under commitment. In the former case the central bank sets the interest rate by optimizing period-by-period a microfounded welfare function while in the latter case the central bank solves a dynamic optimization problem incorporating the forward-looking behavior of consumers and firms. We will talk about *time inconsistency* of policies and discuss the main differences between discretion and commitment in terms of adjustment dynamics and welfare effects. Instructor Tiziano Ropele

Fiscal policy in medium-scale New Keynesian DSGE model (3 hours). We will introduce fiscal policy in a medium-scale New Keynesian DSGE model in order to discuss the notion of *Ricardian Equivalence Proposition* (REP) and then present the conditions under which the REP breaks down. In this latter regard, we will familiarize with a simple DSGE model with heterogeneous agents (optimizing consumers vs. rule-of-thumb consumers) to study the effects of government spending shocks. Instructor Tiziano Ropele

Models with incomplete markets and heterogeneous agents (6 hours). In this last part of the module we will lay the foundations to build a class of models whose equilibria feature a nontrivial endogenous distribution of income and wealth across agents. This setting is particularly apt to address positive and normative policy questions regarding the redistributive and welfare effects of fiscal and monetary

policies, consumption insurance, etc. We will work with economies characterized by “incomplete markets” where agents are subject to idiosyncratic income shocks and can only borrow/save through a risk-free bond. We will discuss in detail the individual problem and then characterize the income and wealth distribution. Because quantitative heterogeneous-agent modelling requires some knowledge in computational methods, we will also briefly sketch common solution approaches.
Instructor Tiziano Ropele

Tutorials (12 hours). Instructor Bianca Barbaro

Introduction to simulation with the software Dynare. Simulation of DSGE models

Essential references (additional material will be made available as the course unfolds).
